

## Parts Purchasing can be a Strategic Advantage for Your Business. Here's How.

Potential for improvement exists in every aspect of manufacturing—if you know where to look and what to do. With DRIVE™ Supply Chain & Procurement Services, your facility can enhance its strategic advantage through improved parts procurement, an often under-utilized best practice in factory maintenance.

DRIVE™ is ATS' multi-faceted Maintenance, Repair and Operations (MRO) Asset Management Solution designed to drive efficiency, expanded machine life, reduced downtime, improved manpower utilization, and increased production insights. Comprised of four interconnected programs, DRIVE™ is a powerful way to drive MRO to a new level of value.

DRIVE™ Supply Chain & Procurement, one of the four DRIVE™ programs, upgrades your parts purchasing and logistics efforts for increased effectiveness. Beginning with 24/7/365 procurement support, the program sources hard-to-find parts, optimizes on-site vs. off-site inventory, continually reviews supplier performance and much more. This data-driven discipline fine tunes all the elements of procurement—including pricing, inventory control and geography—to create exceptional value and ROI.

### MAXIMIZE YOUR PRODUCTIVITY

DRIVE™ Supply Chain & Procurement, available in combination with other DRIVE™ programs or as a standalone option, has two key objectives: first, to drive efficiency in your operating environment; and second, to operate a lean logistics delivery system that's free of waste. Elements include:

- ➔ 24/7/365 Support: Emergency procurement from trained personnel for critically time-sensitive needs
- ➔ Hard-to-Find Parts Sourcing: In addition to locating difficult or obsolete parts, ATS has licensed over 400 legacy components including PanelMate operator interface products. 3D printing services also available.
- ➔ Proactive Procurement Support: Continual review of parts supplier portfolios to ensure optimal pricing, logistics and customer support
- ➔ Intra-site Logistics: Data-driven solutions that optimize what has to be held onsite vs. what can be kept offsite or delivered just-in-time, resulting in lower carrying costs while maintaining availability
