Effective Change Management Tips for the Industrial Internet of Things (IIoT)

It is estimated that by the year 2020, 50 billion connected devices will be in use, and there will be no shortage of valuable data that can help make companies more efficient and productive. But organizations are struggling to decide how to analyze and leverage this abundance of information on the plant floor. Individual plants face unique challenges that make the introduction of the Industrial Internet of Things (IIoT) difficult, but these challenges do not make the implementation of this technology impossible.

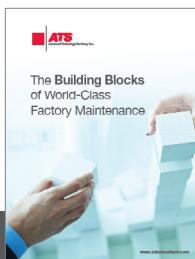

Chris LeBeau, Director of IT at Advanced Technology Services, recently spoke at Process Expo, the nation's largest trade show dedicated to bringing the latest technology and integrated solutions to the food and beverage industry. During his presentation he shared insights on ways manufacturing organizations can leverage IIoT and effectively implement these technologies into to standard, valuable data unique to their business goals.
