## Examining employer and employee perceptions of the skills gap

The skills gap is no new phenomenon, especially in industries like manufacturing, where most current employees are reaching retirement age and the next-generation workforce is choosing other career options. According to the 2017 Skills Gap Report released by Udemy, 80 percent of full-time U.S. employees believe there is a skills gap, but the perception of its impact varies among industry, seniority, generation, and even gender.

*ATS' Chris Hobbs, Program Manager for Technical Training, discusses these differing views between employers and employees when it comes to reskilling, millennial learning power, and the hard and soft skills needed for success in the manufacturing industry.*
